

# Virtual Radio

## The first worldwide radio receiver on mobile phones!

Click and Play!	VirtualRadio is based on one single basic functionality: playing a given set of Internet radio channels. This allows us to keep the audio player simple and usable: users start up the player and it immediately starts playing audio. There is no need to define play lists or find and type in URLs. All the user has to do is select from a given set of channels: click and play! It's easy!
Supported Phone Types	VirtualRadio currently runs on Nokia S60 phones. Other smart phones using the Symbian OS will follow. VirtualRadio is Symbian certified!
Technology	VirtualRadio is a streaming audio system for 3G phones. The streamed format is MP3. VirtualRadio consists of a player application, an application server and streaming servers.  The servers used do NOT include any royalties or licence fees!
Radio Stations	The set of radio channels within VirtualRadio will be continually expanded. New stations are constantly being added, making this application the first universal radio player for mobile phones.  Any radio station with adequate sound can be integrated into VirtualRadio! Let us know you're there, we'll help you get things started and do the rest. Set-up costs are incredibly minimal!
Mobile Phone Operators	VirtualRadio is a typical 3G application, but it can also be used on GPRS and EDGE networks.  All the operator needs to do is provide the user with valid information regarding the access point to the mobile Internet.
Customized Versions	Radio Stations and Mobile Phone Operators interested in this application can obtain a customized and uniquely branded version that will make a difference in graphic design and in the selection of radio channels.
